### Abstract

In this paper we introduced the notion "  $b\tau$ - dense sets" in bitopological spaces and proved some of their properties and related theorems by using the concept of  $b\tau$ -open set .

**المستخلص :**

في هذا البحث قدمنا مفهوم المجموعات بي تاو- الكثيفه وبي تاو-غير الكثيفه في الفضاءات ثنائية التوبولوجيا واثبتنا بعض الخواص المتعلقة بها باستخدام مفهوم المجموعات بي تاو-المفتوحه

### Introduction:

In 2007, M. Ganster and M. Steiner [6] introduce the concept of  $b\tau$ -closed set, which the complement of it is called  $b\tau$ -open set where they defined a subset  $A$  of a topological space  $X$  to be  $b\tau$ -closed if  $cl_b(A) \subset U$  whenever  $A \subset U$  and  $U$  is open, where  $cl_b(A)$  denoted to the intersection of all  $b$ -closed sets containing a subset  $A$ .in this paper we used a corresponding concept, i.e.  $\tau_1\tau_2b\tau$ -open in bitopological spaces, where the study of Bitopological space initiated by Kelly [3],[5] is defined as : A set equipped with two topologies is called a bitopological space, denoted by  $(X, \tau_1, \tau_2)$  where  $(X, \tau_1)$  and  $(X, \tau_2)$  are two topological spaces defined on topological spaces defined on  $X$

**Definition (1-1):** [8] A subset  $S$  of  $X$  is called  $\tau_1\tau_2$  open if  $S \in \tau_1 \cup \tau_2$  and the complement of  $\tau_1\tau_2$ - open set is  $\tau_1\tau_2$ -closed.

**Example (1-2):** Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{\phi, X, \{a\}\}$  and  $\tau_2 = \{\phi, X, \{b\}\}$ . The sets in  $\{\phi, X, \{a\}, \{b\}\}$  are called  $\tau_1\tau_2$  open and the sets in  $\{\phi, X, \{b, c\}, \{a, c\}\}$  are called  $\tau_1\tau_2$  closed.

**Definition (1-3):**[1] A subset  $A$  of a space  $(X, \tau_1, \tau_2)$  is said to be  $\tau_1\tau_2b$ -open set if  $A \subset \tau_1\tau_2 cl(\tau_1\tau_2 \text{int}(A)) \cup \tau_1\tau_2 \text{int}(\tau_1\tau_2 cl(A))$

**Remark(1-4):**

- 1) The complement of  $\tau_1\tau_2b$ -open set is called  $\tau_1\tau_2b$ -closed set.
- 2) The intersection of all  $\tau_1\tau_2b$ -closed sets of  $X$  containing a subset  $A$  of  $(X, \tau_1, \tau_2)$  is called  $\tau_1\tau_2b$ -closure of  $A$  and is denoted by  $\tau_1\tau_2b-cl(A)$ . Analogously the  $\tau_1\tau_2b$ - interior of  $A$  is the union of all  $\tau_1\tau_2b$ -open sets contained in  $A$  denoted by  $\tau_1\tau_2b-int(A)$ .

**Definition (1-5):** A subset  $A$  of a bitopological space  $(X, \tau_1, \tau_2)$  is called to be  $\tau_1\tau_2b\tau$ -open if  $\tau_1\tau_2b-cl(A) \tau_1\tau_2b-cl$

**Definition (1-6):** Let  $(X, \tau_1, \tau_2)$  be a bitopological space and  $A \subseteq X$ . Then  $A$  is called a  $\tau_1\tau_2b\tau$ -neighbourhood of a point  $x$  in  $X$ , if there exist  $\tau_1\tau_2b\tau$ -open set  $U$  in  $X$  such that  $x \in U \subset A$ .

**Definition (1-7):** The union of all  $b\tau$ -open sets contained in a set  $A$  is called  $b\tau$ -interior of  $A$  and denoted by  $b\tau-int(A)$ .

**Definition (1-8):** The intersection of all  $b\tau$ -closed sets containing a set  $A$  is called  $b\tau$ -closures of  $A$  and denoted by  $b\tau-cl(A)$ .

**Definition (1-9):** A point  $x \in X$  is said to be a  $b\tau$ -limit Point if and only if  $U$  is  $\tau_1\tau_2b\tau$ -open set implies  $U \cap (A - \{x\}) \neq \emptyset$ . where  $\emptyset$  is the empty set.

**Definition (1-10):** The set of all  $b\tau$ -limit points of  $A \subseteq X$ , is called the  $b\tau$ -drived set of  $A$  and is denoted by  $b\tau\text{-D}(A)$ .

**Definition (1-11):** The set  $b\tau\text{cl}(A) - b\tau\text{int}(A)$  is called  $b\tau$ -frontier of  $A$  is denoted by  $b\tau\text{-f}(A)$ .

**Remark (1-12) :** every  $\tau_1\tau_2$ -closed set is  $\tau_1\tau_2b$ -closed set and every  $\tau_1\tau_2b$ -closed set is  $\tau_1\tau_2b\tau$ -closed set .

**Proposition (1-13) :**Every  $\tau_1\tau_2$ -closed subset of a bitopological space  $(X, \tau_1, \tau_2)$  is  $\tau_1\tau_2b$ -closed.

**Proof:**Let  $A \subseteq X$  be  $\tau_1\tau_2$ -closed set, since  $A^c \subset \tau_1\tau_2\text{cl}(A^c)$ , hence  $\tau_1\tau_2\text{int}(A^c) \subset \tau_1\tau_2\text{int}(\tau_1\tau_2\text{cl}(A^c))$ , but  $\tau_1\tau_2\text{int}(A) \subset A$  for any subset  $A$ , hence  $A^c \subset \tau_1\tau_2\text{int}(\tau_1\tau_2\text{cl}(A^c))$ , and  $A^c \subset \tau_1\tau_2\text{int}(\tau_1\tau_2\text{cl}(A^c)) \cup \tau_1\tau_2\text{cl}(\tau_1\tau_2\text{int}(A^c))$ , hence  $A^c$  is  $\tau_1\tau_2b$ -open set, hence  $A$  is  $\tau_1\tau_2b$ -open set .□

**Remark(1-14) :**The converse of Proposition (1-13) is not true as the following example

**Example (1-15):**  $\tau_1\tau_2b$ -closed set  $\nrightarrow \tau_1\tau_2$ -closed set. Let  $X = \{a, b, c\}$ ,  $\tau_1 = \{X, \phi, \{a\}, \{b\}, \{a, b\}\}$ ,  $\tau_2 = \{X, \phi, \{b\}\}$ , then the sets in  $\{X, \phi, \{b, c\}, \{a, c\}, \{c\}\}$  are  $\tau_1\tau_2$ -closed and the set in  $\{X, \phi, \{b, c\}, \{a, c\}, \{c\}, \{a\}, \{b\}\}$  are all  $\tau_1\tau_2b$ -closed, so  $\{a\}, \{b\}$  are  $\tau_1\tau_2b$ -closed but not 123-closed set.

**Proposition (1-16) :**Every  $\tau_1\tau_2b$ -closed subset of a bitopological space  $(X, \tau_1, \tau_2)$  is  $\tau_1\tau_2b\tau$ -closed.

**Proof:**

Let  $A \subseteq X$  be  $\tau_1\tau_2b$ -closed set, and let  $A \subseteq U$ , where  $U$  is  $\tau_1\tau_2$ -open, since  $A$  is  $\tau_1\tau_2b$ -closed set, hence  $\tau_1\tau_2\text{int}(\tau_1\tau_2\text{cl}(A)) \cap \tau_1\tau_2\text{cl}(\tau_1\tau_2\text{int}(A)) \subset A$ , but  $A \subset U$ , hence  $\tau_1\tau_2\text{int}(\tau_1\tau_2\text{cl}(A)) \cap \tau_1\tau_2\text{cl}(\tau_1\tau_2\text{int}(A)) \subset U$ , since  $\tau_1\tau_2\text{cl}_b(A)$  is the smallest  $\tau_1\tau_2b$ -closed set containing  $A$ , so,

$$\begin{aligned} \tau_1\tau_2\text{cl}_b(A) &= A \cup (\tau_1\tau_2\text{int}(\tau_1\tau_2\text{cl}(A)) \cap 123\text{cl}(123\text{int}(A))) \\ &\subset A \cup U \\ &\subset U, \end{aligned}$$

i.e.  $A$  is  $\tau_1\tau_2b\tau$ -closed.□

**Remark (1-17):**the converse of Proposition (1-16) is not true as the following example

**Example (1-18)**  $\tau_1\tau_2b\tau$ -closed set  $\nrightarrow \tau_1\tau_2b$ -closed set. For the same example (1.15), the set  $\{a, b\}$  is  $\tau_1\tau_2b\tau$ -closed but it is not  $\tau_1\tau_2b$ -closed set.

**Theorem (1-19):** Let  $A$  be a subset of abitopological space  $(X, \tau_1, \tau_2)$  . then  $\tau_1\tau_2b\tau\text{-cl}(A)$  is closed and  $A \subseteq \tau_1\tau_2b\tau\text{-cl}(A)$  further  $A$  is closed if and only if  $A = \tau_1\tau_2b\tau\text{-cl}(A)$  .

**Theorem (1-20):** Let  $A$  be a subset of abitopological space  $(X, \tau_1, \tau_2)$ . then  $\tau_1\tau_2b\tau\text{-int}(A)$  is open  $\tau_1\tau_2b\tau\text{-int}(A) \subseteq A$  further  $A$  is open if and only if  $A = \tau_1\tau_2b\tau\text{-int}(A)$ .

**Theorem (1-21):** Let  $A$  be a subset of abitopological space  $(X, \tau_1, \tau_2)$  Then  $\tau_1\tau_2b\tau\text{-int}(A) = X - \tau_1\tau_2b\tau\text{-cl}(X-A)$  and  $\tau_1\tau_2b\tau\text{-cl}(A) = X - \tau_1\tau_2b\tau\text{-int}(X-A)$  .

**Proof:** Since  $X-A \subseteq \tau_1\tau_2b\tau\text{-cl}(X-A)$  we have  $X - \tau_1\tau_2b\tau\text{-cl}(X-A) \subseteq A$  . But  $X - \tau_1\tau_2b\tau\text{-cl}(X-A)$  is open (by theorem (1-19)), so  $X - \tau_1\tau_2b\tau\text{-cl}(X-A) \subseteq \tau_1\tau_2b\tau\text{-int}(A)$ . On the other hand,  $X - \tau_1\tau_2b\tau\text{-int}(A)$  is closed by theorem(1-20), and  $X-A \subseteq X - \tau_1\tau_2b\tau\text{-int}(A)$ , so  $\tau_1\tau_2b\tau\text{-cl}(X-A) \subseteq X - \tau_1\tau_2b\tau\text{-int}(A)$  . And hence  $\tau_1\tau_2b\tau\text{-int}(A) \subseteq X - \tau_1\tau_2b\tau\text{-cl}(X-A)$ . This shows that  $\tau_1\tau_2b\tau\text{-int}(A) = X - \tau_1\tau_2b\tau\text{-cl}(X-A)$ , and the other relation follows from replace  $A$  by  $X-A$  ■

**2-  $b\tau$ -densnesse set in bitopological spaces**

**Definition(2-1):** Let A be a subsets of thebitopological space  $(X, \tau_1, \tau_2)$ .Then A is said to be  $\tau_1\tau_2$   $b\tau$ -dense in X if  $\tau_1\tau_2 b\tau$ -cl(A)=X .

**Definition(2-2):** A subset A of abitopological space  $(X, \tau_1, \tau_2)$  is **non  $\tau_1\tau_2 b\tau$ -dense** set if  $\tau_1\tau_2 b\tau$ -int( $b\tau$ -cl(A))= $\emptyset$  that is the  $\tau_1\tau_2 b\tau$  - interior of the  $\tau_1\tau_2 b\tau$ -closure of A is empty.

**Theorem(2-3):**Let A be a subset of abitopologicalspace  $(X, \tau_1, \tau_2)$  Then the following statements are equivalent:

- i) A is non  $\tau_1\tau_2 b\tau$ -dense in X.
- ii)  $\tau_1\tau_2 b\tau$ -cl(A) contains no  $\tau_1\tau_2 b\tau$ -nhd.

**Proof :** (i)  $\leftrightarrow$  (ii) we have A is non  $\tau_1\tau_2 b\tau$ -dense

$$\leftrightarrow \tau_1\tau_2 b\tau$$
-int (spcl(A)) =  $\emptyset$

$$\leftrightarrow \text{No point of X is a } \tau_1\tau_2 b\tau$$
-int point of  $b\tau$ -cl(A)

$$\leftrightarrow \tau_1\tau_2 b\tau$$
 cl (A) has not a  $\tau_1\tau_2 b\tau$ -nhd of any of its Points

$$\leftrightarrow \tau_1\tau_2 b\tau$$
 cl (A) contains no  $\tau_1\tau_2 b\tau$ -nhds ■

**Theorem(2-4):** Let A be a subset of a bitopological spaces  $(X, \tau_1, \tau_2)$

if A is non  $\tau_1\tau_2 b\tau$ -dense, then  $\tau_1\tau_2 b\tau$ -cl(A) is not the entire space X.

**Proof:** Since X is  $\tau_1\tau_2 b\tau$ -closed then  $X = \tau_1\tau_2 b\tau$ -cl(X). Again since X is

$\tau_1\tau_2 b\tau$ -open, we have  $\tau_1\tau_2 b\tau$ -int( $\tau_1\tau_2 b\tau$ -cl(X))= $\tau_1\tau_2 b\tau$ -int(X)=X. Since A is non  $\tau_1\tau_2 b\tau$ -dense in X,  $\tau_1\tau_2 b\tau$ -int( $\tau_1\tau_2 b\tau$ -cl(A)) =  $\emptyset$  . Thus  $\tau_1\tau_2 b\tau$ -int( $\tau_1\tau_2 b\tau$ -cl(X))=X ,And  $\tau_1\tau_2 b\tau$ -int( $\tau_1\tau_2 b\tau$ -cl(A))= $\emptyset$  . It follows  $A \neq X$  ■

**Theorem (2-5):** The union of finite number of non  $\tau_1\tau_2 b\tau$ -dense set is non  $\tau_1\tau_2 b\tau$ -dense sets.

**Proof :** it suffices to prove that the theorem for the case of two non sp-dense sets ,say A and B For simplicity we put  $G = \tau_1\tau_2 b\tau$ -int( $\tau_1\tau_2 b\tau$ -cl(A  $\cup$  B)) So that  $G \subset \tau_1\tau_2 b\tau$ -cl(A  $\cup$  B) =  $\tau_1\tau_2 b\tau$ -cl(A)  $\cup$   $\tau_1\tau_2 b\tau$ -cl(B). It follows that  $G \cap [\tau_1\tau_2 b\tau$ -cl(B)]'  $\subset$  ( $\tau_1\tau_2 b\tau$ -cl(A)  $\cup$   $\tau_1\tau_2 b\tau$ -cl(B))  $\cap$  [ $\tau_1\tau_2 b\tau$ -cl(B)]' = [ $\tau_1\tau_2 b\tau$ -cl(A)  $\cap$  ( $\tau_1\tau_2 b\tau$ -cl(B))']  $\cup$  [ $\tau_1\tau_2 b\tau$ -cl(B)  $\cap$  ( $\tau_1\tau_2 b\tau$ -cl(B))'] =  $\tau_1\tau_2 b\tau$ -cl(A)  $\cap$  ( $\tau_1\tau_2 b\tau$ -cl(B))' Since [ $\tau_1\tau_2 b\tau$ -cl(B)  $\cap$  ( $\tau_1\tau_2 b\tau$ -cl(B))'] =  $\emptyset$   $\subset$   $\tau_1\tau_2 b\tau$ -cl(A). Then  $\tau_1\tau_2 b\tau$ -int( $G \cap$  (( $\tau_1\tau_2 b\tau$ -cl(B))'))  $\subset$   $\tau_1\tau_2 b\tau$ -int( $\tau_1\tau_2 b\tau$ -cl(A)) =  $\emptyset$  , since A is non  $\tau_1\tau_2 b\tau$ -dense. But  $\tau_1\tau_2 b\tau$ -int [ $G \cap$  ( $\tau_1\tau_2 b\tau$ -cl(B))]' =  $G \cap \tau_1\tau_2 b\tau$ -cl(B)', Since  $G \cap$  ( $\tau_1\tau_2 b\tau$ -cl(B))' is an sp-open set ,It follows that  $G \cap$  ( $\tau_1\tau_2 b\tau$ -cl(B))' =  $\emptyset$  , which implies  $G \subset \tau_1\tau_2 b\tau$ -cl(B) then  $\tau_1\tau_2 b\tau$ -int (G)  $\subset$   $\tau_1\tau_2 b\tau$ -int ( $\tau_1\tau_2 b\tau$ -cl(B)) =  $\emptyset$ ,Sinse [B is non  $\tau_1\tau_2 b\tau$ -dense] .

But  $\tau_1\tau_2 b\tau$ -int(G) =  $\tau_1\tau_2 b\tau$ -int[ $\tau_1\tau_2 b\tau$ -int( $\tau_1\tau_2 b\tau$ -cl (A  $\cup$  B))] =  $\tau_1\tau_2 b\tau$ -int( $\tau_1\tau_2 b\tau$ -cl(A  $\cup$  B)). So that  $\tau_1\tau_2 b\tau$ -int ( $\tau_1\tau_2 b\tau$ -cl(A  $\cup$  B)) =  $\emptyset$ . Hense A  $\cup$  B is non  $\tau_1\tau_2 b\tau$ -dense ■

**Theorem(2-6) :**Let A be a subset of abitopological spaces  $(X, \tau_1, \tau_2)$ ,Then A is non  $\tau_1\tau_2 b\tau$ -dense in X if and only if  $X - \tau_1\tau_2 b\tau$ -cl(A) is  $\tau_1\tau_2 b\tau$ -dense in X.

**Proof:** By theorem (1-21)  $\tau_1\tau_2 b\tau$ -int(A) =  $X - \tau_1\tau_2 b\tau$ -cl(X-A) and  $\tau_1\tau_2 b\tau$ -cl(A) =  $X - \tau_1\tau_2 b\tau$ -int (X-A) it follows that  $\tau_1\tau_2 b\tau$ -int( $\tau_1\tau_2 b\tau$ -cl(A))=  $X - \tau_1\tau_2 b\tau$ -cl(X- $\tau_1\tau_2 b\tau$ -cl(A)). Sinse A is non  $\tau_1\tau_2 b\tau$ -dense then  $\tau_1\tau_2 b\tau$ -int( $\tau_1\tau_2 b\tau$ -cl(A))= $\emptyset$  then  $X - \tau_1\tau_2 b\tau$ -cl(X- $\tau_1\tau_2 b\tau$ -cl(A)) =  $\emptyset$  then  $\tau_1\tau_2 b\tau$ -cl(X- $\tau_1\tau_2 b\tau$ -cl(A)) = X then  $\tau_1\tau_2 b\tau$ -cl(X- $\tau_1\tau_2 b\tau$ -cl(A)) is  $\tau_1\tau_2 b\tau$ -dense ■

**Definition (2-7) :** A subset  $A$  of a bitopological spaces  $(X, \tau_1, \tau_2)$  is called  $\tau_1\tau_2 b\tau$ -dense-in-itself if  $A \subseteq \tau_1\tau_2 b\tau - D(A)$  that is every points of  $A$  is  $\tau_1\tau_2 b\tau$ -limit point of  $A$  .

**Example (2-8):** let  $X = \{a, b, c, d, e\}$  , with  $\tau_1 = \{ \emptyset, X, \{b\}, \{d, e\}, \{b, d, e\}, \{a, c, d, e\} \}$ ,  $\tau_2 = \{ \emptyset, X, \{b\} \}$  are a topology on  $X$  .consider the subset  $A = \{a, c\}$ , then  $a$  is  $\tau_1\tau_2 b\tau$ - limit point of  $A$  since the  $\alpha$ -nhds of  $a$  are  $\{a, c, d, e\}$  and  $X$  each of which contains a point of  $A$  other than  $a$  , also  $c$  is  $\tau_1\tau_2 b\tau$ -limit point of  $A$  since the  $\alpha$ -nhds of  $c$  are  $\{a, c, d, e\}$  and  $X$  each of which contains a point of  $A$  other than  $c$  .hence  $A$  is  $\tau_1\tau_2 b\tau$ -dense-in-itself .

**Theorem (2-9):** If  $A$  is  $\tau_1\tau_2 b\tau$ -dense-in-itself set then  $\tau_1\tau_2 b\tau - cl(A)$  is  $\tau_1\tau_2 b\tau$ -dense-in-itself.

**Proof :** By theorem (let  $A$  be a subset of a topological space bitopological spaces  $(X, \tau_1, \tau_2)$  then  $\tau_1\tau_2 b\tau - cl(A) = A \cup \tau_1\tau_2 b\tau - D(A)$  [2],[3] ) since  $A$  is  $\tau_1\tau_2 b\tau$ -dense-in-itself that is ( every point of  $A$  is  $\tau_1\tau_2 b\tau$ - limit point of  $A$ ) then  $A \cup \tau_1\tau_2 b\tau - D(A) = A$  hence  $\tau_1\tau_2 b\tau - cl(A) = A$  then  $\tau_1\tau_2 b\tau - cl(A)$  is  $\tau_1\tau_2 b\tau$ -dense-in-itself ■

**Theorem (2-10) :** The union of any family of  $\tau_1\tau_2 b\tau$ --dense-in-itself sets is  $\tau_1\tau_2 b\tau$ --dense-in-itself .

**Proof :** let  $\{A_i\}$ ,  $i \in I$ , be a family of  $\tau_1\tau_2 b\tau$ --dense-in-itself sets . so  $A_i \subseteq \tau_1\tau_2 b\tau - D(A_i) \forall i \in I$ , Let  $p \in \cup A_i$  then  $p \in A_i$  .for some  $i \in I$ . Hence for each  $\tau_1\tau_2 b\tau$ --pen set  $U$  with  $p \in U$ ,  $A_i \cap (U - \{p\}) \neq \emptyset$ . Thus  $(\cup A_i) \cap (U - \{p\}) \neq \emptyset$ , hence  $p \in (\tau_1\tau_2 b\tau - D(\cup A_i))$  therefore  $\cup A_i \subseteq (\tau_1\tau_2 b\tau - D(\cup A_i))$ ; hence  $\cup A_i$  is  $\tau_1\tau_2 b\tau$ --denes-in-itself ■
