Numerical Treatment of First Kind Fredholm Integro-Differential Equations Via Spline Functions
Atefa Jalil Salh Abdullah

Abstract:
In this paper some algorithms of numerical treatment for Fredholm integro-differential equations [FIDEs] of the first kind three types of Spline functions: Linear, Quadratic and Cubic are introduced. The values of the involved integrals in each algorithm are evaluated numerically using trapezoidal rule. The program for each method is written in Matlab (V.6) language. A comparison among the three types has been done depending on the last squares errors and running time.
Numerical Treatment of First Kind Fredholm Integro-Differential Equations Via Spline Functions
Atefa Jalil Salh Abdullah

1- Introduction:

Much attention has been given [5,6,8,9] on the numerical solution of Fredholm integro-differential equations [FIDE_S] of first kind. This kind of equation as the form:

\[ u'(x) + p(x)u(x) = g(x) + \int_a^b k(x,y)u(y)dy, \quad x \in I = [a,b] \quad ........(1) \]

with the initial condition \( u(a) = u_0 \), where the functions \( f \) and \( p \) are assumed to be continuous on \( I \), \( k \) denotes given continuous function, were the interval \([a,b]\) is divided in to \( n \) equal subintervals, such that \( h = (b-a)/n \), \( y_0 = a \), \( y_n = b \) and \( y_j = a + jh \), \( j = 0, 1, ..., n \). We set \( x_i = y_j \), \( i = 0, 1, ..., n \), \( u'(x_i) = u_i \), \( p(x_i) = p_i \), \( f(x_i) = f_i \), \( u(x_i) = u_i \) and \( k(x_i, y_j) = k_{ij} \).

And

\[ \int_0^b K(x,t)f(t)dt = g(x), \quad 0 \leq x \leq b \quad ........(2) \]

is the Fredholm integral equation of first kind, where \( k(x,t) \) and \( g(x) \) are known functions, \( f(t) \) is the unknown function. We consider the problem is obtaining \( f(t) \) values at discrete point in [10].

The numerical solution of the Fredholm integral Eq.(2) has been studied via orthogonal functions in [7] and weighted residual methods in [1]. Taylor series is approached in [2]. The main feature of these methods is its reduction the Fredholm integral Eq.(2) to algebraic forms which are proceeded by forward substitution in order to obtain the results in [10].

In this work, spline functions are used to treat Eq.(2). Here the interval \([0,b]\) is divided into a collection of subintervals, which is followed by a construction of different approximating polynomial on each subinterval.
2- Brief Review of Spline Functions:
To facilitate the presentation of material, a brief review of spline functions is given in this section. The three types of spline function are considered in [3,4]

2.1 First Degree Spline (L(x)):
The spline of 1st degree is a simple example for the spline functions whose pieces are linear polynomials.

The linear spline function $L(x)$ consists of $n-1$ piecewise linear function, in an interval $[t_i,t_{i+1}]$, i.e.

$$
L(x) = \begin{cases} 
L_i(x) & x \in [t_1, t_2] \\
L_2(x) & x \in [t_2, t_3] \\
 & \vdots \\
L_{n-1}(x) & x \in [t_{n-1}, t_n]
\end{cases}
$$

where $L_i(x) = A_i(x) + B_i$ where $i = 1,2,3,...n-1$

If the 1st degree function $L(x)$ is continuous, which is called a spline, then
(i) The domain of $L$ is an interval $[t_1, t_n]$
(ii) $L$ is continuous on $[t_1, t_n]$
(iii)There are a partition of the interval $t_1 < t_2 < ... < t_n$.

2.2 Quadratic Spline Q(x):
The quadratic spline function $Q(x)$ consists of I piecewise quadratic foundation as follows:

$$
Q(x) = \begin{cases} 
Q_1(x) & x \in [t_1, t_2] \\
Q_2(x) & x \in [t_2, t_3] \\
 & \vdots \\
Q_{n-1}(x) & x \in [t_{n-1}, t_n]
\end{cases}
$$
Numerical Treatment of First Kind Fredholm Integro-Differential Equations Via Spline Functions

Atefa Jalil Salh Abdullah

which is continuously differentiable on the interval \([t_i, t_{i+1}]\) and \(Q_i(t_i) = y_i\),  \(i = 1,2,....,n\)

put \(z_i = Q'(t_i)\)

Hence, the formula for \(Q_i\) on \([t_i, t_{i+1}]\) is:

\[
Q_i(x) = \frac{z_{i+1} - z_i}{2(t_{i+1} - t_i)}(x-t_i)^2 + z_i(x-t_i) + y_i
\]

......(3)

with the three conditions:

\(Q_i(t_i) = y_i\),  \(Q'_i(t_i) = z_i\) and  \(Q'_i(t_{i+1}) = z_{i+1}\)

The necessary and sufficient condition in Eq.(3) is

\[
Q_i(t_{i+1}) = y_{i+1}, \quad i = 1, 2, ..., n-1
\]

Therefore, the result is:

\[
z_{i+1} = -z_i + 2 \left( \frac{y_{i+1} - y_i}{t_{i+1} - t_i} \right), \quad i = 1, 2, ..., n-1
\]

......(4)

where \(z_1\) is arbitrary.

2.3 Cubic Spline \(S(x)\):

Cubic spline is the most common piecewise polynomial approximation which consists of \(n-1\) cubic polynomial pieces as follows:

\[
S(x) = \begin{cases} 
S_1(x) & \text{if } x \in [t_1, t_2] \\
S_2(x) & \text{if } x \in [t_2, t_3] \\
S_{n-1}(x) & \text{if } x \in [t_{n-1}, t_n] 
\end{cases}
\]
Numerical Treatment of First Kind Fredholm Integro-Differential Equations Via Spline Functions
Atefa Jalil Salh Abdullah

subject to:
\[ S_i(t_i) = S_i, \quad i = 1, 2, ..., n \]
\[ S_{i+1}(t_{i+1}) = S_i(t_{i+1}) \]
\[ S_{i+1}'(t_{i+1}) = S_i'(t_{i+1}), \quad i = 1, 2, ..., n-1 \]
\[ S_{i+1}'' (t_{i+1}) = S_i''(t_{i+1}) \]

where \( S, S', S'' \) are all continuous functions on \([t_1, t_n]\).

The formula for \( S_i \) can be obtained by using Newton form and divided difference table for \( S_i \).

\[ S_i(x) = c_{1,i} + c_{2,i}(x-t_i) + c_{3,i}(x-t_i)^2 + c_{4,i}(x-t_i)^3 \]  
\[ ......(4.a) \]

with
\[ C_{1,i} = S_i(t_i) = S_i \]
\[ C_{2,i} = S_i'(t_i) = S_i' \]
\[ C_{3,i} = S_i''(t_i)/2 = ([t_i, t_{i+1}]S_i - S_i')/h - c_{4,i}h \]  
\[ ......(4.b) \]
\[ C_{4,i} = S_i'''(t_i)/6 = (S_i' + S_i''_{i+1} - 2[t_i, t_{i+1}]S_i)/h^2 \]

Substituting (4.b) in (4.a) and let \( S_i(t_{i+1}) = S_{i+1} \), we have

\[ S_i(x) = S_i + S_i'(x-t_i) + ([t_i, t_{i+1}]S_i - S_i')/h - c_{4,i}h(x-t_i)^2 + ((S_i' + S_i''_{i+1} - 2[t_i, t_{i+1}]S_i)/h^2)(x-t_i)^3 \]  
\[ ......(5) \]

Since \( S'' \) is continuous function hence
\[ S_{i-1}''(t_i) = S_i''(t_i) \]

or
\[ hS_{i-1}' + 4hS_i' + hS_{i+1}' = b_i \]

with
\[ b_i = 3h([t_{i-1}, t_i]S_i + [t_i, t_{i+1}]S_i), \quad i = 2, ..., n-1 \]
Numerical Treatment of First Kind Fredholm Integro-Differential Equations Via Spline Functions

Atefa Jalil Salh Abdullah

3- Reduction to Integral Equation:

The reduction of integro-differential equations [IDEs] to integral equations can be used for the analysis of variety of fredholm integro-differential equations [FIDEs].

Reduction theorem[1]

Let g, k be iterated L_2 integrable function on interval [a,b] and \( P_i \in C^n[a,b] \) then Eq.(5) is:

\[
[D^n + \sum_{i=1}^{n-1} P_i(t)D^i]f(t) = g(t) + \int_a^t K(t,s)f(s)ds, \quad t \in [a,b]
\]

……(6)

with initial the conditions \( f(a) = f_0, f'(a) = f_1, \ldots, f^{(n)}(a) = f_n \)

can be reduced to linear fredholm integral equation [FIE] in the form:

\[
f(t) = G_n(t) + \int_a^b K_n(t,s)f(s)ds
\]

where

\[
G_n(t) = \sum_{i=0}^{n-1} \frac{f_i t^i}{i!} + \frac{1}{(n-1)!} \int_a^t (t-s)^{n-1} f(s)ds + \sum_{k=0}^{n-1} \sum_{j=n+k-1}^{n-1} (-1)^k P_j^{(k)}(a) A_{n-k-j} \frac{f_{j+k-n-1} t^j}{j!}
\]

and

\[
K_n(t,s) = \frac{1}{(n-1)!} \int_t^b (t-z_i)^{n-1} k(z_i, s)dz_i - \sum_{k=0}^{n-1} \sum_{j=n+k-1}^{n-1} (-1)^j P_j^{(k)}(s) B_{n-k-1,j} \frac{(t-s)^k}{k!}
\]

where A and B are two special constant matrices of dimensions \( n-2 \times n-2 \) and \( n-1 \times n-1 \), respectively.

4- Solution of Fredholm integro-differential Equation:

Recall eq. (1)

\[
\int_a^b k(x,t)f(t)dt = g(x), \quad a \leq x \leq b
\]

In this section, the spline functions Linear, quadratic and cubic are used to find the numerical solution of Eq.(2).
4.1 Using Linear Spline Functions L(x):

Linear interpolation in the interval \([t_i, t_{i+1}]\) gives the formula in [5]:

\[ L_i(x) = A_i(x)y_i + B_i(x)y_{i+1} \]

......(7)

where \( A_i(x) = \frac{t_{i+1} - x}{h} \), \( B_i(x) = 1 - A_i(x) = \frac{x - t_i}{h} \) and \( h = t_{i+1} - t_i \)

let \( y_i = L_i(t_i) \), \( i = 1, 2, ..., n \)

substituting Eq.(7) into Eq.(2) for \( f(y) \), we obtain

\[ g_r = \sum_{j=0}^{x_{i+1}} k(x_r, y)[A_j(y)y_j + B_j(y)y_{j+1}]dy, \quad r = 1, 2, ... \]

......(8)

where \( g_r = g(x_r) \),

Eq.(8) is solved by iteration and the integrals which are approximated by trapezoidal rule.

4.2 Using Quadratic Spline Functions Q(x):

The formula of a quadratic Spline functions \( Q(x) \) in the interval \([t_i, t_{i+1}]\) is :

\[ Q_i(x) = A_i(x)Q_i + B_i(x)Q_i' + C_i(x)Q_i'_{i+1} \]

......(9)

where

\[ A_i(x) = 1, \quad B(x) = \left( x - t_i \right) - \left( x - t_i \right)^2 \quad 2h \]

\[ C_i = \frac{(x-t_i)^2}{2h} \]

Let \( Q_i(t_i) = Q_i, \quad Q_i'(t_i) = Q_i' \) and \( Q_i'(t_{i+1}) = Q_i'_{i+1} \)

Substitute Eq.(9) in Eq.(2) and obtain:
Numerical Treatment of First Kind Fredholm Integro-Differential Equations Via Spline Functions
Atefa Jalil Salh Abdullah

\[ g_r = \sum_{j=0}^{r-2} \int_{x_j}^{x_{j+1}} k(x, y) \left( A_i(y) Q_i + B_i(y) Q'_i + C_i(y) Q'_{i+1} \right) dy + \]
\[ \int_{x_{r-1}}^{x_r} k(x_r, y) \left( A_{r-1}(y) Q_{r-1} + B_r(y) Q'_r + C_r(y) Q'_r \right) dy \]

......(10)

Note that, for the continuity of \( Q' \), the requirement should be :
\[ Q'_{i+1} = - Q_i + \frac{2}{h} (Q_{i+1} - Q_i) , \quad i = 0, 1, ... \]

......(11)

Eq.(10) is solved by iteration using Eq.(11).

4-3 Using Cubic Spline Functions \( S(x) \):

The cubic spline functions \( S(x) \) in the interval \([t_i, t_{i+1}]\) of Eq.(5) Can be written as :
\[ S_i(x) = A_i(x) S_i + B_i(x) S_{i+1} + C_i(x) S'_i + D_i(x) S'_{i+1} \]

...... (12)

where
\[ A_i(x) = 1 - 3 \left( \frac{x-t_i}{h} \right)^2 + 2 \left( \frac{x-t_i}{h} \right)^3 , \]
\[ B_i(x) = 1 - A_i(x) , \]
\[ C_i(x) = (x-t_i) \left( \frac{x-t_{i+1}}{h} \right)^2 \quad \text{and} \quad D_i(x) = \left( \frac{x-t_i}{h} \right)^2 (x-t_{i+1}) \]

Substituting Eq.(12) into Eq.(2), this yields :
\[ g_r = \sum_{j=0}^{r-2} \int_{x_j}^{x_{j+1}} k(x, y) \left[ A_j(y) S_j + B_j(y) S_{j+1} + C_j(y) S'_j + D_j(y) S'_{j+1} \right] dy + \int_{x_{r-1}}^{x_r} k(x_r, y) \left[ A_{r-1}(y) S_{r-1} + B_{r-1}(y) S_r + C_r(y) S'_{r-1} + D_{r-1}(y) S'_r \right] dy \]

...... (13)
Numerical Treatment of First Kind Fredholm Integro-Differential Equations Via Spline Functions
Atefa Jalil Salh Abdullah

with
\[ S'_{i-1} + 4S'_i + S'_{i+1} = \frac{3}{h} (S_{i+1} - S_{i-1}) , \quad i = 1, 2, \ldots, n-1 \]

Since the central difference for the first derivative is:
\[ S'_i \approx \frac{S_{i+1} - S_{i-1}}{2h} \]

......(14)

So
\[ S'_i \approx 2S'_i - S'_{i-1} , \quad i = 1, 2, \ldots, n-1 \]

......(15)

Finally, eq. (13) is solved by central difference in Eq.(15) to get an approximate solution for Eq.(2).

5- Numerical Examples:

Example (1):

Consider the following problem after reducing the [FIDE], we get:
\[ \int_a^b \cos(x - y)f(y)dy = x , \quad 0 \leq x \leq 1 \]

where the exact solution \( f(x) = 1 + \frac{x^2}{2} \)

The solution of \( f(x) \) for \( 0 \leq x \leq 1 \) is required.

Take \( h = 0.1 \), and use the spline functions: Linear, quadratic and cubic discussed in section 3, the results are obtained as shown in table (1) with the exact solution, least square errors (L.S.E.) and running time (R.T.) are also listed for comparison.

6- Conclusion:
In this paper, a method of using spline functions has been presented for solving Fredholm integro-differential equations [FIDEs] of the first kind. It has been shown that the proposed method is convenient for computer programming.

For the comparison of computing accuracy and the speed, the last square error and running time are given in tables conclude that: the cubic spline gives a better accuracy than quadratic and linear spline.

Numerical Treatment of First Kind Fredholm Integro-Differential Equations Via Spline Functions

المستخلص:
قدمت الخوارزميات لمعالجة معادلات فريدهولم التكاملية - التفاضلية من النوع الأول عددياً باستخدام دوال الثلمة: الخطية، التربيعية والتكعيبية، استخدمت طريقة شبه المنحرف لحساب قيم التكاملات الموجودة في الخوارزميات عددياً. تم كتابة برنامج لكل طريقة بلغة ماتلاب وتمت المقارنة بين الانواع الثلاثة لدوال الثلمة بالاعتماد على مربع مجموع الاخطاء وزمن تنفيذ البرنامج.

تم الحمد لله
