Accepted – December – 2010

Summary

Aqueous extract of DI leaves was given to mice , at graded dose (100&200mg/kg.B.W.P.O) to evalut its antidiarrhoal potential by using four experimentally induced diarrhoea treated groups each consis of five mice and one control group. Castor oil and magnesium sulphate were used to induce diarrhoea in mice. The extract at both doses showed a remarkable antidiarrhoal activity manifested by significant delay in onset of diarrhoea , decrease in number of wet stools , total number of stools and total weight of fecal output in 4 hours in both castor oil and magnesium sulphate induced diarrhoal groups of mice. The results of this study reveal that The aqueous extract of Datura innoxia leaves contains pharmacologically active substance with antidiarrhoal properties .These properties may explain the rational use of the plant as antidiarrhoal agent in the traditional medicine.

Key word: antidiarrhoal, Datura innoxia, leave extract,castor oil, magnesium sulphate.

**Introduction**

The World Health Organization (WHO) has constituted a diarrhoeal disease program, which has been encouraged studies for treatment and prevention of diarrhoeal diseases using traditional medical practices (1). Medical plants are promising source of anti diarrhoeal drug (2). It is becomes important to identify and evaluate commonly available natural drug, which are not completely free from adverse effects. A range of medicinal plant with anti diarrheal properties has been widely used for traditional therapy; however, the effectiveness of many of these have not been scientifically evaluated, one of them is Datura, where the flower of Datura innoxia was traditionally used in treatment of diarrhea and gastrointestinal disturbances in infant. Datura plant is very important medicinal plant as it is well known source of the tropane alkaloids; hyoscyamine, atropine and scopolamine (hyoscine). The total alkaloid yield has been estimated to be between 0.06 and 0.5%(3), Hyoscine has anticholinergic, antiasthmatic and antispasmodic effect. Hyoscyamine has similar chemical structure to hyoscine, but it is different only by a single molecule of oxygen. Hyoscyamine has the same pharmaceutical effects as hyoscine. Atropine is the racemic for Hyoscyamine which effect the nervous system(4). Atropine is used in eye drop preparation. It is also used to treat nerve gas poisoning, parkinsons disease, peptic ulcer, diarrhea and bronchial asthma. In addition to these alkaloids, the plant contains other minor tropane derivatives, as well as chlorogenic acid and lectins.(5) Since this plant is abundant in Iraq, information about its tropane antispasmodic and antidiarrhoea effects have been not well established. So present work took step forward to do study on Iraq local plant datura innoxia aiming the following:

1- Induce diarrhoea in mice by using magnesium sulphate or caster oil.

2- compare the antidiarrhoea effect of different doses of aqueous datura innoxia with loperamide.

3- Determining the mechanism of its anti diarrhoeal action.

**Materials and Methods:**

Plant materials: Crude aqueous extract of Datura innoxia leaves was prepared by using 60g of dried powdered of plant leaves. The dry powdered plant leaves were put in pyrex flask (500ml) containing (200ml) distilled water, mixed by magnetic stirrer at 40C for 24 hours then filtered to get rid of residue and placed in an incubator at 40C to produce a dried extract. The dried extract was weighed and kept at -20C in sterile petridish. The net weight of dry extract of DI leave was 3g making the yield 5%. Animals: Twenty five Albino swiss mice weighing 25-30g of either sex were used. The animals were grouped and kept in cage housed at standard condition of light and ventilation and have freely access to standard rodent diet (commercial feed pellets) and tap water. The animal were kept for a week for acclimitazion. Experiment-1 Study of DI extract activity against diarrhea induced by castor oil: This was done according to the method, described by (6). The animals were all tested initially by giving Them 0.5 ml of castor oil. only those who showed diarrhea were selected for the final experiment. Twenty five mice were selected and devided equally into five group which submitted for the following treatment: Negative control group(cont-ve): normal mice received distilled water at adose of 10ml/kg B.W.P.O.-positive control group(cont+ve): induced diarrhea mice received distilled water at a dose of 10ml/kg B.W.P.O. - loperamide treated group - induced diarrhea mice dosed with loperamide at a dose of 3mg/kg B.W.P.O. Two datura innoxia...
treated groups- induced diarrhea mice and recived DI aqueous extract at adose of 100and200 mg/kg B.W.P.O. respectively . Each mouse was placed over a glass funnel , the floor of which was lined with weighed paper ,changed every hour. Diarrhoea was induced by oral administration of 0.5 ml of castor oil to each mouse ,45minute after the above treatmeant. The following parameter were observed for aperiod of 4 hour. The onset of diarrhea stool (first wet stool that leaves ahalo on the weighed paper).

1. Number of wet stools.
2. Total number of stools.
3. Total weight of feces.

Experiment-2: Study of DI extract activity against diarrhea induce by magnesium sulphate: This was done according to the method , described by (7),.Twenty five mice were divided equally into five groups as in the castor oil induced diarrhea experiment , with the same pretreatmeant measures before induction of diarrhea . After 30 minutes diarrhea was induced by oral administration of magnesium sulphate at a dose of 2g/kg B.W. to each mouse .Asimilar parameters for castor oil induce diarrhea experiment were measured. Statistics analysis: Results were expressed as means ± standard error that subjected to statistical analysis using one-way analysis of variance (ANOVA) and LSD. The significance level considered was ( p < 0.01).

**Results and discussion**

Four hours after castor oil administration, all the mice in control group produced copious diarrhoea .Pretreatmeant of mice with aqueous extract of datura innoxia at doses of 100 or 200mg/kg B.W.P.O caused adose dependent significant(P<0.01) delay in the onset of diarrhoea , decrease in the number of wet stools , total number of stools. Decrease in the total weight of fecal output also was noticed .However, the reduction in the above measured parameters that showed after administration of DI aqueous extracts at doses were comparatively less than that produced by loperamid (table,1-) . It is well known that castor oil or its active component ricinoleic acid induced permeability change in mucosal fluid and electrolyte transport that result in hypersecretory response and diarrhoea (8). Castor oil broken down in the small intestine to recinolic acid which is very irritating to gut promptly increases peristalsis(9). Datura plant is very important medicinal plant as it is well known source of the tropean alkaloids; hyoscyamine ,atropine and scopolamine (hyoscine) .The total alkaloid yield has been estimated to be between 0.06 and 0.5%(3). Tropae alkaloids are commonly as anti-cholinergic compounds, due to their ability to bind to muscarinic acetylcholine receptors and hence acting as competitive antagonists at these receptors. Atropine is a non-selective antagonists of all classes of muscarinic receptors M1,M2,M3,M4 and M5 . but known to have a stimulating effect on the central nervous system , whereas scopolamine is a depressant of the central nervous system (10). The result of antidiarreoal activity of DI extract against diarrhea induce by magnesium sulphate in mice were listed in table.2. In this model the aqueous exerect of datura innoxia at doses of 100 and 200 mg/kg B.O.W.P.significantly (P<0.01) reduced the extent of diarrhoea in mice . Both doses were shown to delay in the onset of diarrhoea, decrease in the the number of wet stools,total number of stools and decrease in the total weight of fecal output significantly at (P<0.01).

Mean value different letter signifies significant value (P<0.01) F_test. DI=Datura innoxia leave aqueous extract.

However, loperamid also showed more reduction in the extent of diarrhoea when compared with DI extract effect in mice. Magnesium sulphate are non absorbable salts(Bulking agents) that hold in the water in the by osmosis, and distend the bowel, increasing intestinal activity and producing defication (11). It has also been demonstrated that it promotes the liberation of cholecytokinin from the duodenal mucosa, which increases the secretion and motility of small intestine and thereby prevent the reabsorption of sodium chloriod and water (12 and 13) have mentioned that alkaloids such as atropine and scopolamine constitute an important class of anticholinergic compounds derived from plants that occur in Datura species. clinically, they are used to block the muscarinic activity of acetylcholine showing antispasmodic and antisecretory effects in the treatment of spastic colitis, gastroenteritis and peptic ulcer. They are also useful pharmacological tools to discover new active principles with gastrointestinal tract action (2). The leaves and seed of Datura are widely used in herbal medicine as anaesthetic, antispasmodic, antitussive, and bronchodilator and as hallucinogenic (14). Aqueous extract of Datura innoxia leaves showed antispasmodic effect on isolated rabbit duodenum. That was attributed to trapan alkaloids, atropine and scopolamine identified by related standard in TLC (1). DI extract seem to have...
effect against diarrhea induced by irritant and bulk diarrhea agent. DI aqueous extract showed dose dependent antidiarrheal effect but at dose 200mk/kg antidiarrhea effect was even lesser but approximate to loperamide effect. It seems that the use of higher doses of DI extract may give similar antidiarrheal effect as loperamide.
