

التجربة الصينية في الإصلاح والتنمية : بحث في خصوصية المنهج والدروس المستخلصة

المستخلص

ABSTRACT

The Chain's experience of reform and development monopolized with deep and exclusive concerns of the world.

Starting from the academic departments of universities and researches and study centers to the world's organizations and institutes passing through the government and the official systems in many countries that get affected , positively or negatively, now or later by china's economic development .

Searching in the china's experience of reform and development is important because it takes place in a developing country in which the leadership is succeeded in choosing the right methodology an model of changing and operating economics, making use of all the past national and international experiences in both the negative and the positive sides . though the result was that China became the fourth economic power in the world.

According to that we would say that this experience acts as an experimental field of a bond of strategy, policies, programs, and reform and developing procedures.

The consequential results would participate in maturing the developing philosophy which is related to the needs of progressing economy and taking the right political decisions towards reformational manner in developing countries.

However, this does not mean in anyway that the ability of copying china's experience or its reproduction by other developing countries , is possible, and that is because of the differences in the circumstances and data that frame this experience. What is possible then is how to make use of this experience and its results.

China's experience has peculiarity related to the civilization, historic, cultural, social, geographical, and population standards of China, which in all formalize a worldly unique case.

This specialty is also related to China's leadership's policy in operating the reformation and development.

The most important characteristics of this policy is the balanced and careful gradually increasing progress and the ignorance of the shock treatment which has been used in other countries proving its uselessness.

The policies and mechanisms procedures which are used in operating and developing the economic activity like the market-economics and economics-openness and appealing the foreign investments, all of these take place in an exclusive developing view of how the state's role is positive and powerful.

So, through a willing independent policy China makes use of its powerful elements (large market, cheap hands, and a particular geo-political location), making use of all of these and from a powerful point by dealing and negotiating with the foreign sides (states, foreign companies, international organizations).

What is mentioned above does not mean in anyway that China's economics is healthy and does not suffer challenges and problems. Its challenges and problems starts with ten thousand of billions of china's people who still live under the poverty line .

And does not end at the commitments and measures of international environment , because there is the problem of keeping this difficult formula of the political central system that takes the multilaterals and free marketing mechanism.

So does china's economics succeed in facing these problems? This is a question which is left to history judgment .
